

AI Audit Report — Task 3

Student: Đặng Đăng Khoa — 23127207 **Date:** 2026-08-02 **Timezone:** Asia/Bangkok (UTC+7) **Status:** HUMAN_REVIEWED — BLOCKED_THIRD_REQUIRED_PLATFORM

Interaction 1 — Execute Task 3 with complete evidence

Field	Value
AI tool	OpenAI Codex with local PowerShell, Node.js, Playwright, Chrome, Firefox, WebKit and Expo Web
Date/time	2026-08-02, TIME_NOT_EXPORTED
User prompt	thực hiện luôn task 3, chụp lại đầy đủ evidence
AI output/use	Read the official nine-page HW03 PDF and the repository GUI-testing skill; identified the exact Chrome/Firefox/Safari-or-Android requirement and student-overlay constraint; inventoried installed browsers/cloud credentials/Android tooling; started the local EShop services; built a 58-item cross-platform runner; captured identity/platform/URL overlays; generated 232 result rows, 160 screenshots, matrices, findings, reports and validators.
Human /source control	No cloud credentials, macOS/Safari host, Android emulator or physical device existed. The AI did not rename WebKit as Safari or emulation as Android. The package therefore remains blocked at 2/3 eligible platforms.

Harness corrections

Correction	Detection	Resolution	Evidence impact
Two navigation locators matched both header and form links; one XSS dialog listener remained active.	Initial Chrome run produced 55/58 rows and three scenario errors.	Scoped links to main and removed the unused listener.	Initial run was excluded; Chrome was rerun to 58/58 with zero scenario errors.
Mobile API proxy passed an unresolved Promise as Content-Type .	Mobile successful login returned backend 500 consistently; console log contradicted the intended live test.	Awaited headerValue , reran the seven Mobile screenshots for every environment and verified the synthetic name appeared in the header.	Final Mobile Login 009 is Pass on all environments; no false SUT bug retained.
Keyboard scenario clicked the page before pressing Tab, changing the starting focus.	A supplemental WebKit status differed while source inspection showed positive tabIndex=1 .	Reran from a genuinely unfocused document and captured eight Tab targets; refined the check to compare positive-submit and first-input indices.	Final status is consistently Fail; evidence records engine-specific sequences without a false browser-only defect.
Three inherited Task 1 expectations asserted automatic whitespace normalization, Category Edit and duplicate-name rejection without requirement support.	Human review compared the expected results with FR-02/FR-14 and the retained runtime observations.	Corrected the expectations, updated the future runner and audibly reclassified the same three observations through reconcile-task1- expectations.js .	Per-platform totals changed from 34/23/1 to 37/20/1. Original screenshots and capture timestamps remain unchanged; JSON stores the reconciliation note.

Tools and data handling

Tool	Purpose	Data handling
Playwright	Browser execution, assertions, screenshots, dialog/network observation	Synthetic accounts/categories/products; student identity only in required overlay
Google Chrome / Firefox	Two rubric-eligible local browser runs	Localhost only
Playwright WebKit / Pixel 7 emulation	Supplemental compatibility evidence	Explicitly labelled non-eligible
Expo Web	Execute the Mobile Login checklist in browser contexts	Hardcoded LAN API redirected to the local backend and disclosed
Node.js	Generate CSV/JSON, matrix and evidence index	No participant data
PowerShell	Service readiness, validator and file-integrity checks	No external publication

Anti-fabrication declaration

- No Safari, BrowserStack, LambdaTest, Sauce Labs, Android device, Expo Go device or physical-phone run is claimed.
- No screenshot is presented as coming from an unavailable platform.
- No participant data from Task 2 is used in Task 3.
- Synthetic test entities use `task3-*` identifiers and are cleaned after capture.
- Mocked states are explicitly marked in `execution_mode`.
- No GitHub issue/comment publication is claimed.

Student review confirmation

The student confirmed in the project conversation that all human-review sections had been reviewed. This confirmation applies to the Task 3 evidence overlays, eligibility decision, findings, audit and critique; it does not waive the unavailable third-platform requirement.

- Review date: `2026-08-02`
- Student confirmation: `HUMAN_REVIEWED` – confirmed by the student in chat
