

AI Use Disclosure Form

Attach to assignments where AI was used in any permitted capacity.

Adapted from Med Kharbach, PhD (2026) — AI Use Policy Templates for Higher Education. CC BY-NC-SA 4.0. This adaptation is prepared for FIT@HCMUS – CS423 / CSC15003 Software Testing course.

1. Course & Student Info

Field	Value
Course:	CS423 / CSC13003 – Software Testing
Assignment ID:	HW04 — Task 1
Assignment Title:	Automation Testing on EShopSut (FR-02, FR-09, FR-14)
AI Use Category (1–5):	Category
Date:	10/08/2026
Student name:	Dang Truong Nguyen
Student ID:	23127438

2. Disclosure Questions

1. AI tool(s) used:

- Claude Code (Claude Fable 5)

2. Stage(s) of the assignment where AI was used:

Tick all that apply: ☒ brainstorming ☒ outlining ☒ drafting ☒ feedback ☒ revision ☒ coding ☒ data analysis ☐ visual design ☐ other (specify).

AI was used to write the Task-1 work plan, design the 40 test cases and their data files, generate the Playwright Page Objects / spec files / multi-browser configuration, triage the multi-browser execution results, draft the summary report (`REPORT.md`), draft the 9 GitHub bug reports, and write the Cloudinary evidence-upload script. I directed every step, reviewed and corrected each artifact, verified all runs, and recorded the demo video myself.

3. Main prompts or tasks given to the AI:

Paste the 2–3 most impactful prompts verbatim. For the full transcript, attach Appendix A (prompt_log.md).

The full prompt-by-prompt trail (with outputs, verdicts and my fixes) is in the AI Audit Report (Section 3). The 3 most impactful:

1. Prompt — Task-1 work plan

hãy viết plan cho task 1 vào folder plan trước, sau đó t sẽ đọc theo plan và cần biết làm gì

2. Prompt — environment setup + Playwright scripts for the 3 chosen features

lấy FR 2, 9 14, hãy setup môi trường và viết code playwright cho 3 feat đó đi

(The AI was then driven step-by-step per the plan: read the SRS sections for FR-02/09/14 → read the real frontend/backend source to derive selectors and seeded data → design ≥ 12 test cases per feature → emit separate JSON data files → generate Page Objects and data-driven specs → run on Chromium/Firefox/WebKit and fix script defects.)

3. Prompt — summary report + templated bug reports filed as GitHub issues

t push lên git r, giờ hãy viết 1 file report md tổng hợp từ các result trước, sau đó viết bug report theo chuẩn template rồi đẩy lên github issue sử dụng gh

4. Specific parts of the work AI contributed to:

Be specific. Example: 'AI generated TC01–TC15 in Section 3.2; I rewrote TC04 and TC11; AI did NOT contribute to Sections 1, 2, 4, or the AI Critique.'

Claude Code generated `plan/task1-plan.md`, the 3 data files (40 test cases), the 3 Page Objects, the 3 spec files, `playwright.config.ts`, `REPORT.md`, the 9 GitHub issue bodies (#390–398), and `scripts/upload-screenshots-cloudinary.mjs`. I chose the 3 features, drove the step-by-step workflow, redesigned test isolation (fresh API-seeded users for lockout/coupon-usage, category snapshot + cleanup), replaced the non-working `getByLabel()` locators, added the API-level 401/403 oracle, diagnosed the port-3000 conflict that broke the first run, caught and repaired the title/body mismatch in the first batch of GitHub issues, verified "Run by: 23127438" inside all 4 HTML report payloads, and confirmed each of the 13 consistently-failing test cases traces to a real spec violation (9 defects). AI did NOT produce the HTML report execution evidence (real runs), the demo video, or the final wording of the AI Critique.

5. How I reviewed, revised, or verified the AI output:

Describe your verification method (ran the test, checked the spec, asked the TA, looked up RFC, cross-checked with the ISTQB syllabus, etc.).

- Executed the full suite on all 3 browsers (120 test executions) and required cross-browser consistency before accepting any failure as a defect: the same 13 test cases fail on Chromium, Firefox and WebKit — zero flaky, browser-specific failures.

- Cross-checked every failing assertion against the SRS (README spec of FR-02/FR-09/FR-14) and against the backend/frontend source to confirm the root cause (e.g., `login_attempts + 2` in `backend/server.js`, `total × (1 - value)` percent formula, strict `>` threshold, missing `authenticateToken` on `/api/apply-coupon`).
- Verified the anti-cheat requirement by decoding the base64-embedded `report.json` of all 4 HTML reports and confirming `options.title` / `metadata` carry "Run by: 23127438" + ISO timestamp.
- Spot-checked the filed GitHub issues (content, labels, template sections) and the Cloudinary-hosted screenshots (HTTP 200) after the link rewrite.

6. Citation (if required by course style guide):

Software Testing uses the IEEE style. Example: Anthropic. (2026). AI Tool (e.g., ChatGPT, Claude, Gemini) [Large language model]. <https://claude.ai>
