

AI Use Disclosure Form

Attach to assignments where AI was used in any permitted capacity.

Adapted from Med Kharbach, PhD (2026) — AI Use Policy Templates for Higher Education. CC BY-NC-SA 4.0. This adaptation is prepared for FIT@HCMUS – CS423 / CSC15003 Software Testing course.

1. Course & Student Info

Field	Value
Course:	CS423 / CSC13003 – Software Testing
Assignment ID:	HW05 — Task 1 & Task 2
Assignment Title:	Performance Testing (Load / Stress / Spike) + AI Analysis & Misinterpretation Hunt on EShopSut
AI Use Category (1–5):	Category
Date:	15/08/2026
Student name:	Dang Truong Nguyen
Student ID:	23127438

2. Disclosure Questions

1. AI tool(s) used:

- Claude Code (Claude Opus 4.8)

2. Stage(s) of the assignment where AI was used:

Tick all that apply: ☒ brainstorming ☒ outlining ☒ drafting ☒ feedback ☐ revision ☒ coding ☒ data analysis ☐ visual design ☐ other (specify).

AI was used to design the “Category-guided buy” end-to-end workflow, generate the four JMeter test plans (Load/Stress/Spike/Soak) via a script, build the data-driven CSV and user pool, write the resource-monitor and `.jtl` -analysis scripts, and draft the evidence documents (Task 1); and — for Task 2 — to analyse the results, propose performance thresholds, and suggest SUT optimizations. I chose the final load parameters, corrected the AI’s mistakes (search keyword, lockout behaviour, timer placement, listener choice, assertions), executed all four scenarios on my own hardware, and wrote the human-

review reasoning and AI Critique myself. For Task 2, the AI-misinterpretation hunt (5 corrections against the raw `.jtl`) and the feasible/hallucinated judgment on each optimization are entirely my own.

3. Main prompts or tasks given to the AI:

Paste the 2–3 most impactful prompts verbatim. All nine prompts (P1–P9) are pasted verbatim in the AI Audit Report (Section 3).

Following the AI-first strategy, I did NOT use a single generic prompt. I decomposed the work into nine focused, verifiable prompts — P1–P7 for Task 1, P8–P9 for Task 2; all nine are pasted verbatim in the AI Audit Report (Section 3). The three most impactful:

1. P1 — plan the assigned work (verbatim)

“đọc đề và README, phần việc của t là Đặng Trường Nguyên 23127438, viết 1 [plan.md](#) để mô tả các bước t cần làm gì” (Translation: read the assignment PDF and README; my part is Dang Truong Nguyen 23127438; write a [plan.md](#) describing the steps I need to do.)

2. P4 — generate the four JMeter plans (verbatim)

“Write a Python generator that emits four JMeter 5.6 plans for this workflow: Load (20 VU, 60s ramp, 5 min, realistic think-time), Stress (step 50→100→200 VU over 7 min), Spike (10 VU baseline + 150 VU burst at t=90s), Soak (30 VU, 12 min). Each plan: recycling CSV Data Set, HTTP defaults localhost:3000, Bearer header from a JSON-extracted token, a CONTENT assertion per request (not status-only), and a DIFFERENT listener per plan (Summary / Aggregate / View Results Tree). Name them {StudentID}_{Scenario}_20260815.jmx.”

3. P5 — probe lockout + safe reset (verbatim)

“On a throwaway user, probe the REAL lockout behaviour (how many wrong logins trigger it, and for how long) and document a reset I can run between Stress/Spike runs WITHOUT restarting the server — check database.js first to confirm whether a restart would wipe the seeded data.”

The remaining prompts (P2 confirm payloads from source, P3 private user pool + data-driven CSV, P6 run + monitor, P7 analyse the raw `.jtl`) are in the AI Audit Report Section 3.

4. Specific parts of the work AI contributed to:

Be specific. Example: ‘AI generated TC01–TC15 in Section 3.2; I rewrote TC04 and TC11; AI did NOT contribute to Sections 1, 2, 4, or the AI Critique.’

Claude Code generated `plan.md`, the four `.jmx` test plans (through `gen_jmx.py`), the 60-row `nguyen_users.csv` plus the registered user pool, the `monitor.sh` and `analyze_jtl.py` scripts, and the draft evidence docs (`test_design.md`, `bug_report.md`, `results_summary.md`, `lockout_probe.md`, `hardware_report.md`). I decided the final workflow scope (#3, no overlap with teammates) and load parameters, corrected six classes of AI error (empty-result keyword, spec-vs-real lockout, destructive DB reset, JMeter timer order, listener memory cost, status-only assertions), executed all four scenarios myself, and wrote the AI Audit conclusion and this disclosure form. AI did NOT produce the raw `.jtl` logs, the resource-monitor screenshots, the hardware report values, the demo video, or the AI Critique.

5. How I reviewed, revised, or verified the AI output:

Describe your verification method (ran the test, checked the spec, asked the TA, looked up RFC, cross-checked with the ISTQB syllabus, etc.).

- I read the SUT backend source (`server.js` , `database.js`) and confirmed every request payload and response field with curl smoke tests before trusting the generated plans — this is how I caught the `Laptop` keyword returning `[]` , the `+2 /180s` lockout (vs the spec's $\geq 3/30s$), and the HTTP-200-empty response for a missing product id.
- I validated every generated `.jmx` as well-formed XML and inspected each thread group, listener, and assertion; I ran a full end-to-end smoke test (login → categories → search → cart → checkout, orderId returned) before the load runs.
- I executed all four scenarios myself on my own hardware (Apple M4, macOS 15.5) with JMeter 5.6.3 non-GUI, kept the raw `.jtl` logs and HTML dashboards, and logged the backend process CPU/RSS every 5s.
- I re-computed p95/p99 directly from the raw `.jtl` with my own `analyze_jtl.py` (independent of JMeter's dashboard) to obtain a trusted ground truth, and reset the lockout with SQL between Stress/Spike runs rather than restarting the server (which would wipe the DB).
